

Abstract

The Norwegian pension reform in 2011 implied a considerable improvement in work incentives for many elderly workers. How did the workers respond? How much more did they work? Was there a difference in the responses based on prior earnings or socioeconomic status? What can be said about winners and losers? What happened with income inequality? These are among the questions I will address in this presentation, which will be based on recent and ongoing research activities at the Frisch Centre.

Bibliography

Knut Røed is Senior Research Fellow at the Ragnar Frisch Centre for Economic Research. He holds a PhD in economics from the University of Oslo (1998). His research interests include labor supply, unemployment, absenteeism, disability, retirement behavior, migration, and public policies aimed at promoting labor market participation. Røed's research has been published in a number of peer-reviewed scientific journals, such as the *Journal of Econometrics*, *Review of Economics and Statistics*, *Journal of Human Resources*, *Journal of Labor Economics*, *Journal of Public Economics*, *Economic Journal*, and the *Journal of the European Economic Association*. He has also participated in a number of Norwegian government commissions, offering recommendations on pension systems, disability insurance design, welfare and migration issues, and employment policies.
